GuidHER

Your personal route safety tracker that helps you make safer commute decisions in one place.

The commute shouldn't be a gamble.

Women don't just plan where they're going.
They plan what they're willing to risk.

Research among 316 college students in Manila found:

51%

of female students experienced sexual assault or harassment while commuting.

43%

of all respondents experienced sexual harassment during transit.

85%

of victims never reported the incident.

Many women **changed how they dressed,** waited only in **well-lit areas**, or **avoided certain stations** to **stay safe.**

Source: Philippine Institute for Development Studies, Transit Crime and Sexual Violence in Cities: Manila, Philippines (2017).

What women commuters are already doing — before GuidHer.

What she does	Cost
Asks the group chat before leaving	Only works if someone in the chat happens to know tonight
Travels in a group	Limits her freedom and schedule
Boards only full jeepneys	Unpredictable waits; sometimes no full jeep comes
Pays for Angkas/Grab to escape unsafe stretch	₱150–₱300 per ride × daily use = economically exclusionary
Avoids evening classes or stays home	Shrinks where and when she can go

Alternatives that fail her:

Alternative	Why it fails
Women-only train cars	Covers only the rail leg — leaves first/last mile unprotected
Panic buttons / SOS apps	Assume a real-time rescue that can't physically happen on a moving vehicle
Generic maps (Google Maps, Waze)	No hyperlocal density; no segment-level conditions

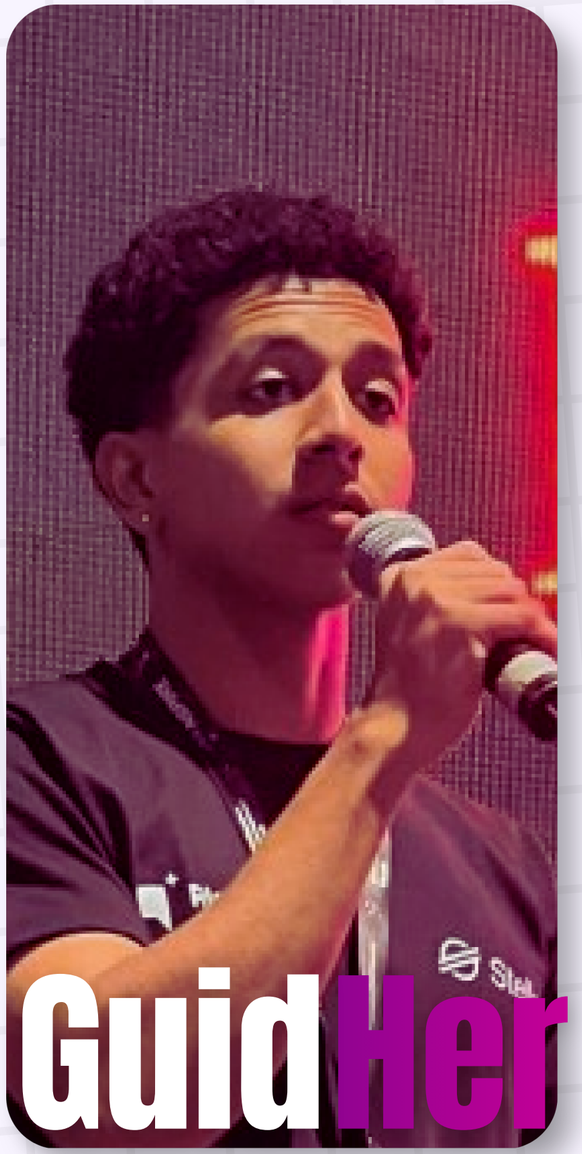

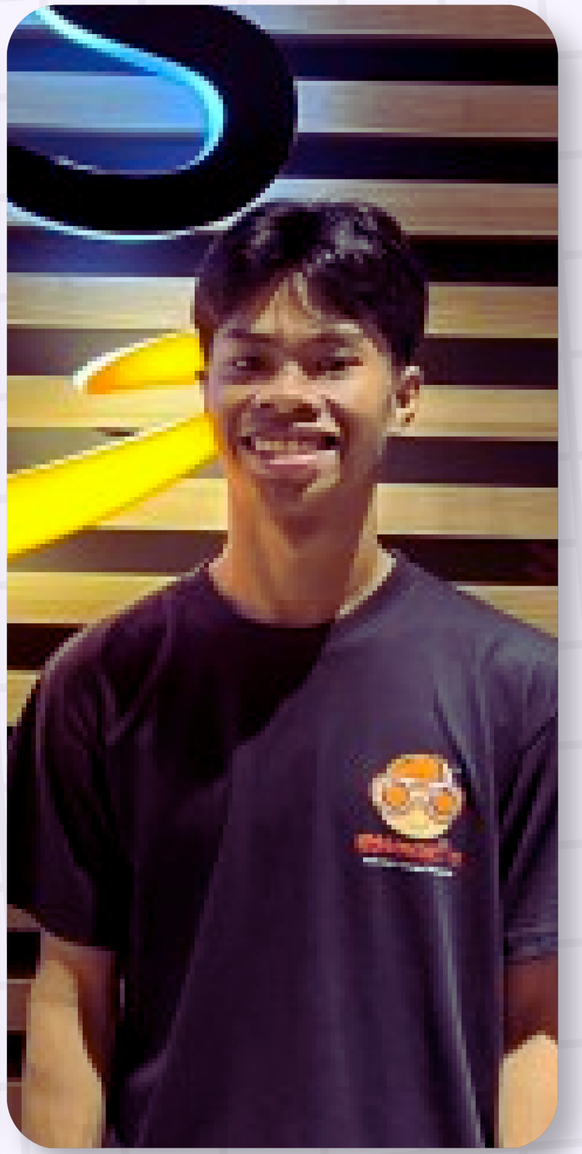

GuidHER

A community-powered route safety platform that transforms shared experiences into actionable guidance.

Meet the TEAM

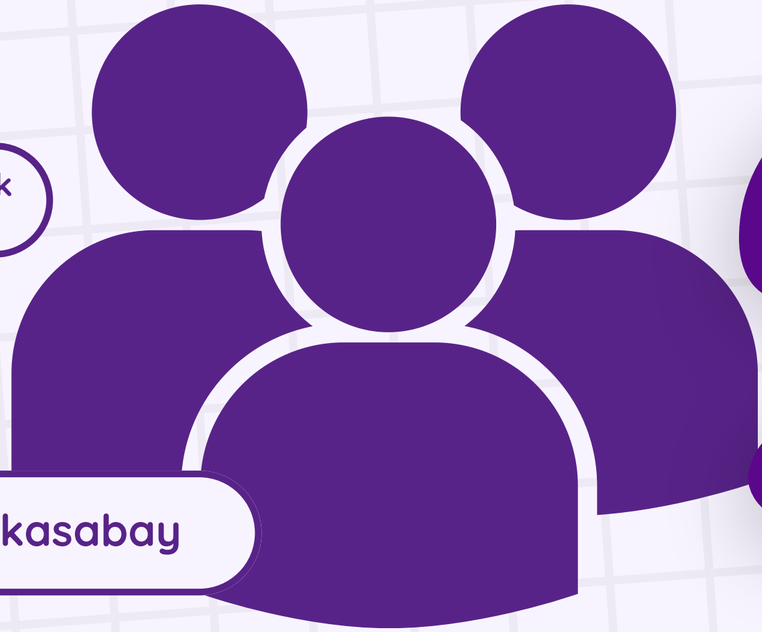

WE DIDNT BUILD THIS ON A HUNCH

They pay extra to skip a dark stretch

They wait for a kasabay

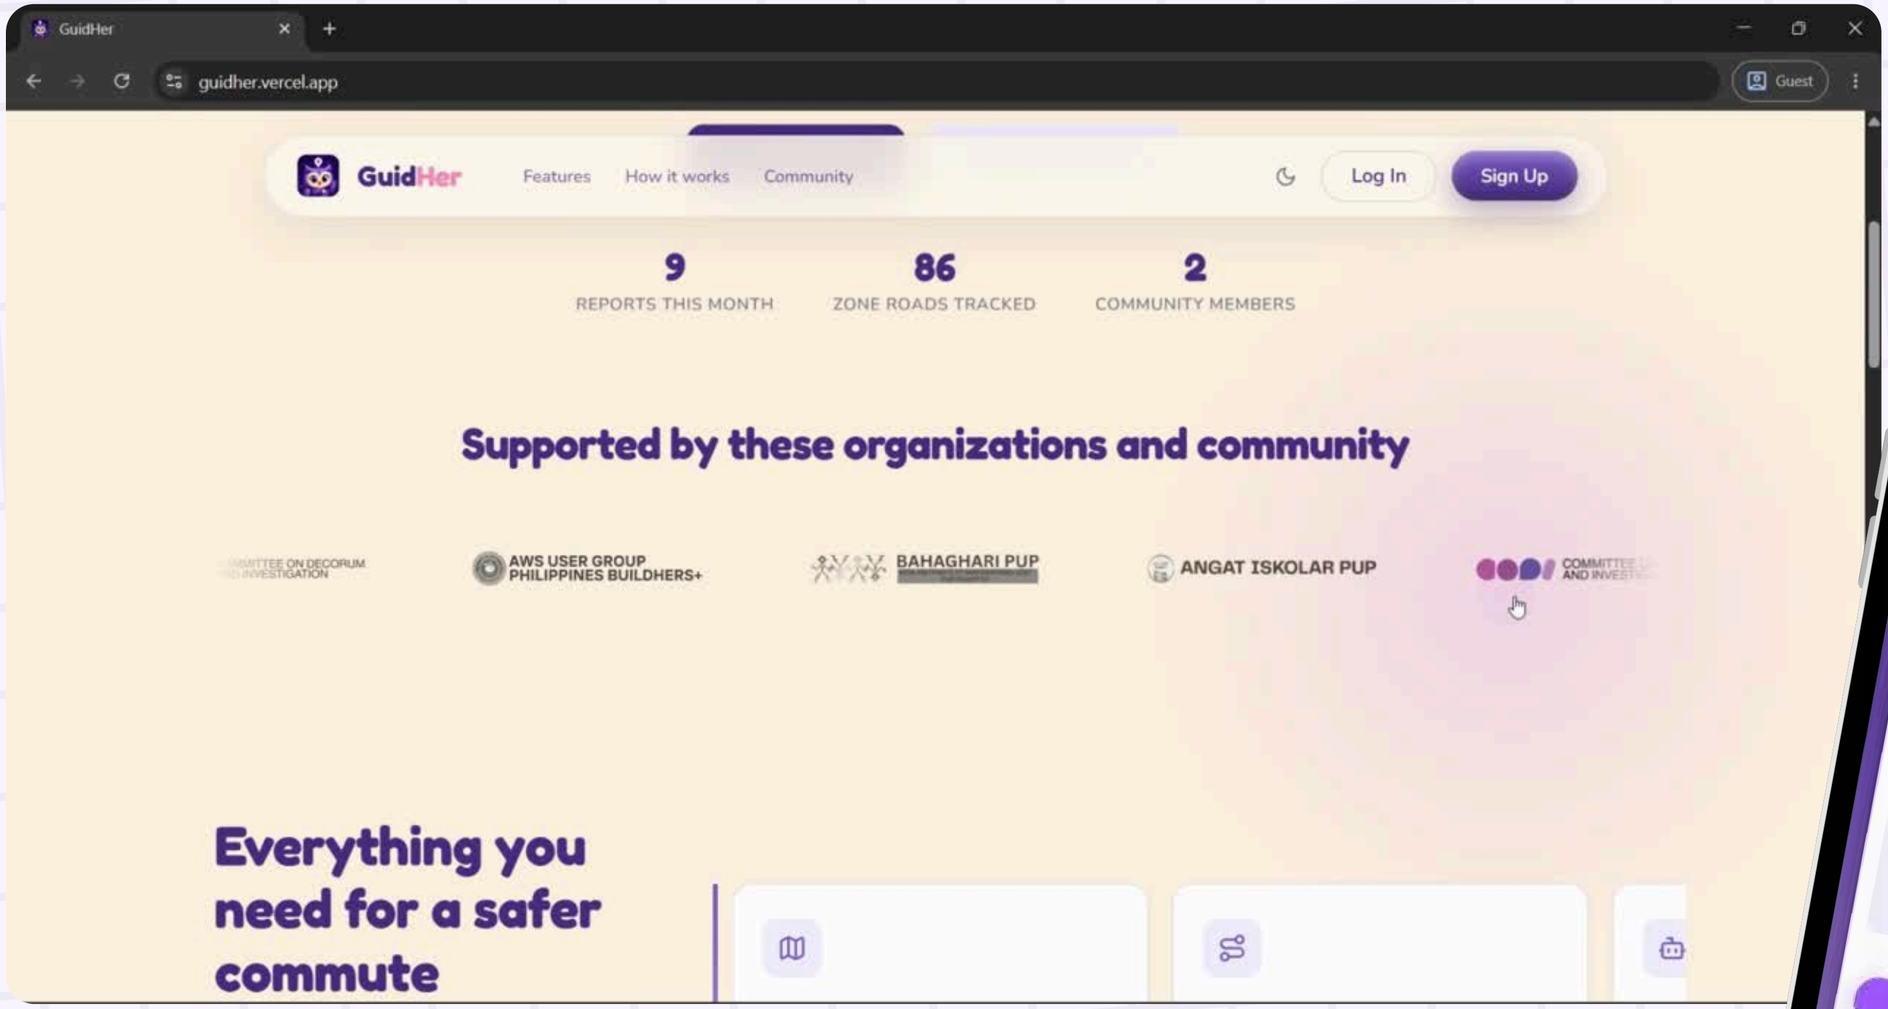

Asks the group chat and search before leaving

Layer	Technology	Why this choice
Frontend	React + Vite · Vercel	Fast SPA; free hosting tier
Map render	MapLibre GL JS + OpenFreeMap	Keyless, free, no billing — zero API cost
Routing	Client-side Rust/WebAssembly engine (built in-house)	No external routing API at all — runs entirely in-browser over a preprocessed pedestrian graph of the Sta. Mesa zone. Works offline. No key, no quota, no cold start.
AI — classification & moderation	Google Gemini API (server-side)	Classifies severity of each report, deduplicates overlapping ones, rejects spam and crime-label text — before anything touches the map
AI — route assessment	Google Gemini API (server-side)	Reads real, current Firestore reports for segments on your route → writes a plain-language verdict. No invented facts.
Database + Auth	Firebase Firestore + Firebase Auth	Free Spark plan; anonymous-first auth with Google sign-in upgrade
Report API	Express (Node.js) on Render	Server-side only — clients can never write reports directly; only the verified server can
